

Assignment - 2

Name: J. Nandini

Roll Number: 2303A51606

Batch - 03

AI Assisted Coding

09-01-2026

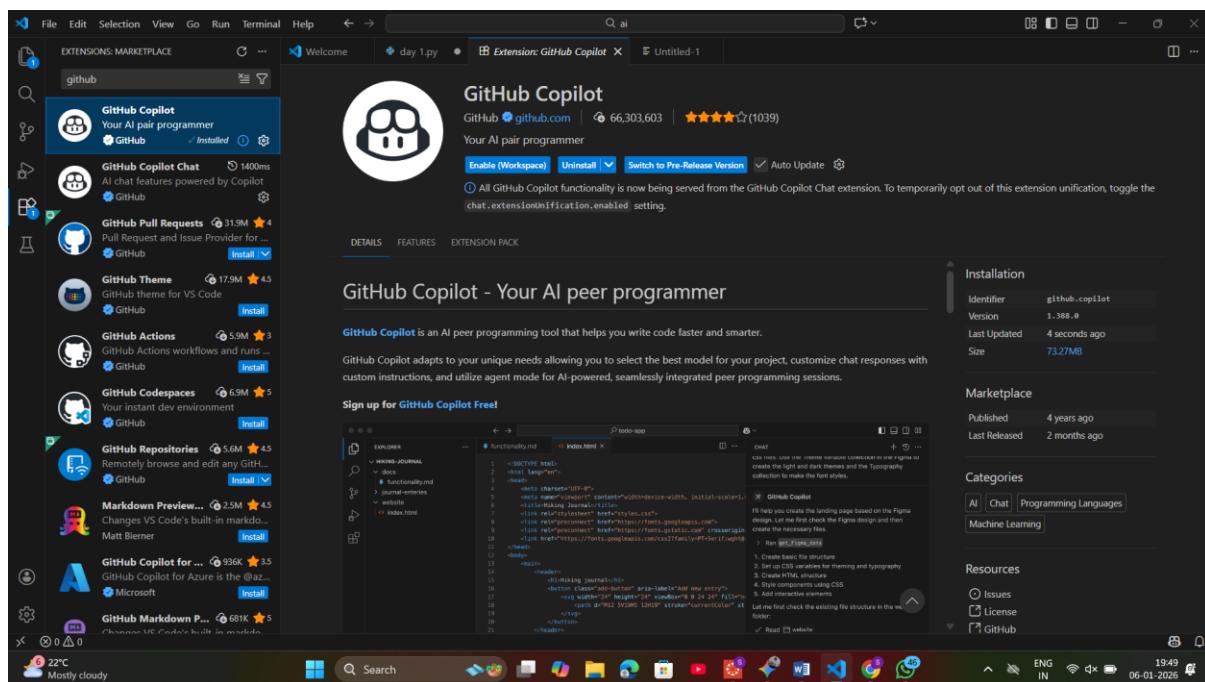

Task 0: Environment Setup:-

Task 0

- Install and configure GitHub Copilot in VS Code. Take screenshots of each step.

Expected Output

- Install and configure GitHub Copilot in VS Code. Take screenshots of each step.

Task 1: Non-Modular Logic (Factorial):-

: AI-Generated Logic Without Modularization (String Reversal Without Functions)

❖ Scenario

You are developing a basic text-processing utility for a messaging application.

❖ Task Description

Use GitHub Copilot to generate a Python program that:

- Reverses a given string
- Accepts user input
- Implements the logic directly in the main code
- Does not use any user-defined functions

❖ Expected Output

- Correct reversed string
- Screenshots showing Copilot-generated code suggestions

➤ Sample inputs and outputs

The screenshot shows the VS Code interface with a Python file named `task1.py` open. The code prompts the user for input, initializes an empty string, loops through the input from back to front, and prints the reversed string. Below the editor is a terminal window showing the execution of the script with the input "2 3 4 5 6". The output shows the original string and the reversed string.

```
C:\> Users > hp > OneDrive > Desktop > ai > task1.py > ...
1 # Accepting user input
2 user_input = input("Enter a string to reverse: ")
3
4 # Initializing an empty string to store the result
5 reversed_string = ""
6
7 # Logic to reverse the string using a loop
8 for i in range(len(user_input) - 1, -1, -1):
9     reversed_string += user_input[i]
10
11 # Printing the result
12 print("Original String:", user_input)
13 print("Reversed String:", reversed_string)

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
PS C:\Users\hp> & C:/Users/hp/AppData/Local/Microsoft/WindowsApps/python3.13.exe c:/Users/hp/OneDrive/Desktop/ai/task1.py
Enter a string to reverse: 2 3 4 5 6
Original String: 2 3 4 5 6
Reversed String: 6 5 4 3 2
PS C:\Users\hp>
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
PS C:\Users\hp> & C:/Users/hp/AppData/Local/Microsoft/WindowsApps/python3.13.exe c:/Users/hp/OneDrive/Desktop/ai/task1.py
Enter a string to reverse: 2 3 4 5 6
Original String: 2 3 4 5 6
Reversed String: 6 5 4 3 2
PS C:\Users\hp>

Task 2: AI Code Optimization:-

Efficiency & Logic Optimization (Readability Improvement)

❖ Scenario

The code will be reviewed by other developers.

❖ Task Description

Examine the Copilot-generated code from Task 1 and improve it by:

➤ Removing unnecessary variables

➤ Simplifying loop or indexing logic

➤ Improving readability

➤ Use Copilot prompts like:

■ “Simplify this string reversal code”

■ “Improve readability and efficiency”

Hint:

Prompt Copilot with phrases like

“optimize this code”, “simplify logic”, or “make it more readable”

❖ **Expected Output**

➤ **Original and optimized code versions**

➤ **Explanation of how the improvements reduce time complexity**

The screenshot shows the VS Code interface. On the left is the code editor with a file named 'task1.py' containing the following Python code:

```
C:\> Users > hp > OneDrive > Desktop > ai > task1.py > ...
1 user_input = input("Enter a string: ")
2
3 # Using Python's slicing for maximum efficiency
4 reversed_string = user_input[::-1]
5
6 print(f"Reversed: {reversed_string}")
```

To the right of the code editor is a terminal window showing the execution of the script and its output:

```
PS C:\Users\hp\OneDrive\Desktop\ai> & 'c:\Users\hp\AppData\Local\Microsoft\WindowsApps\python3.13.exe' 'c:\Users\hp\.vscode\extensions\ms-python.debugpy-2025.18.0-win32-x64\bundled\lib
s\debugpy\launcher' '50075' '--' 'c:\Users\hp\OneDrive\Desktop\ai\task1.py'
Enter a string: 40 50 60 70
Reversed: 70 60 50 40
PS C:\Users\hp\OneDrive\Desktop\ai>
```

Task 3: Modular Design Using AI Assistance (String Reversal Using Functions)

❖ **Scenario**

The string reversal logic is needed in multiple parts of an application.

❖ **Task Description**

Use GitHub Copilot to generate a function-based Python program that:

- Uses a user-defined function to reverse a string
- Returns the reversed string
- Includes meaningful comments (AI-assisted)

❖ **Expected Output**

- Correct function-based implementation
- Screenshots documenting Copilot's function generation

➤ Sample test cases and outputs

The screenshot shows a code editor with a Python file named `task1.py` and a terminal window below it.

`task1.py` content:

```
C:\> Users > hp > OneDrive > Desktop > ai > task1.py > ...
1 def reverse_string_functional(text):
2     """
3         Reverses the input string and returns it.
4     """
5     reversed_text = ""
6     for char in text:
7         |     reversed_text = char + reversed_text
8     return reversed_text
9
10 # Testing the function
11 input_str = input("Enter text: ")
12 result = reverse_string_functional(input_str)
13 print(f"Result: {result}")
```

Terminal output:

```
5 4 3 2 1
5 4 3 2 1
PS C:\Users\hp\OneDrive\Desktop\ai> ^C
PS C:\Users\hp\OneDrive\Desktop\ai>
PS C:\Users\hp\OneDrive\Desktop\ai> c:; cd "c:\Users\hp\OneDrive\Desktop\ai"; & 'c:\Users\hp\AppData\Local\Microsoft\WindowsApps\python3.13.exe' 'c:\Users\hp\vscode\extensions\ms-python
on.debugpy-2025.18.0-win32-x64\bundled\libs\debugpy\launcher' '54371' '--' 'c:\Users\hp\OneDrive\Desktop\ai\task1.py'
on.debugpy-2025.18.0-win32-x64\bundled\libs\debugpy\launcher' '54371' '--' 'c:\Users\hp\OneDrive\Desktop\ai\task1.py'
Enter text: Teju
Result: ujerT
PS C:\Users\hp\OneDrive\Desktop\ai>
```

Task 4: Comparative Analysis – Procedural vs Modular Approach (With vs

Without Functions)

❖ Scenario

You are asked to justify design choices during a code review.

❖ Task Description

Compare the Copilot-generated programs:

➤ Without functions (Task 1)

➤ With functions (Task 3)

Analyze them based on:

➤ Code clarity

➤ Reusability

➤ Debugging ease

➤ Suitability for large-scale applications

❖ Expected Output

Comparison table or short analytical report

Feature	Procedural (Without Functions)	Modular (With Functions)
Code Clarity	Easy for tiny scripts; messy for large ones.	Very high; logic is isolated and named.
Reusability	Must copy-paste code to use it again.	Can be called anywhere in the app.
Debugging	Harder to isolate where an error occurs.	Easy to unit test the specific function.
Scalability	Not suitable for large applications.	Essential for professional development.

Task 5: AI-Generated Iterative vs Recursive Fibonacci Approaches (Different

Algorithmic Approaches to String Reversal)

❖ **Scenario**

Your mentor wants to evaluate how AI handles alternative logic paths.

❖ **Task Description**

Prompt GitHub Copilot to generate:

- **A loop-based string reversal approach**
- **A built-in / slicing-based string reversal approach**

❖ **Expected Output**

- **Two correct implementations**

➤ **Comparison discussing:**

- **Execution flow**
- **Time complexity**
- **Performance for large inputs**
- **When each approach is appropriate.**

The screenshot shows the Visual Studio Code interface with the Python extension installed. The code editor displays a file named `task1.py` containing two functions: `reverse_iterative` and `reverse_slicing`, both of which reverse a string. The terminal below shows the execution of the script and its output.

```
C:\> Users > hp > OneDrive > Desktop > ai > task1.py > ...
1  def reverse_iterative(input_string):
2      reversed_str = ""
3      for char in input_string:
4          reversed_str = char + reversed_str
5      return reversed_str
6
7  def reverse_slicing(input_string):
8      return input_string[::-1]
9
10 test_input = input("Enter a string: ")
11
12 print(reverse_iterative(test_input))
13 print(reverse_slicing(test_input))
